PROBLEM STATEMENT

The problem we are looking to solve with this project is the lack of a centralized source for information regarding the UPRM campus, it's departments and services. The current way the campus provides information regarding it's departments and services is highly inefficient, an individual has to browse through dozens of web pages to find a piece of information with the current distribution of information they provide.

TARGET USERS

The target users for our project will be the students of the UPRM campus.

COST OF DELAY

The cost of delay for this project would be the continued struggle students of the UPRM campus face at the moment whenever they need find information of their campus' services and departments.

CONSTRAINTS

The constraints we would face in doing this project are the following: gathering of campus information, accessibility for students, accuracy of information and usability.

NEW USER EXPERIENCE

The user experience will be designed and made as a Web App, it will provide a centralized source of information of the UPRM campus and some additional tools to improve the student body's experience while obtaining their degree.

VALIDATION & MEASUREMENT PLAN

The project will be validated once we successfully develop an easy to use and complete source of centralized information for the student body of the UPRM campus.
